

Exercises 13

1. Write an XL (or Java) program which prints all prime numbers between 1 and 1000 on the screen (and no other numbers).

Remark 1: An integer is a prime number if it is larger than 1 and if it is not divisible without rest by any other positive integer except 1 and itself.

Remark 2: $\mathbf{a \% b}$ = rest of the division of integer $\mathbf{a}$ by integer $\mathbf{b}$ ($0 \leq (\mathbf{a \% b}) < \mathbf{b}$).

2. Write a turtle command sequence which generates a balls-and-sticks molecule model of formic acid (structural formula: ).

The atoms shall be represented by spheres with different sizes and colours (depending on the chemical element), and the bonds by cylinders (**F(...)** command of the turtle). The double bond shall be represented by a thicker cylinder.

Hint: The colour of an atom **X** can be specified as in the following example:

```
module X extends Sphere(1.0)
  {{ setShader(BLUE); }}
```

Test your solution with GroIMP.

3. (a) Write an L-system which simulates the primary growth of a plant in annual steps. The *annual shoots* of the vertical main axis (stem) shall all have the same length. The uppermost annual shoot shall bear an *apical bud* (= a red sphere) and a *lateral bud* (= a green sphere). The apical bud is supposed to produce a new annual shoot of the main axis next year, and from the lateral bud shall grow a shorter *lateral shoot* with a branching angle of 45° , which will terminate its growth next year (i.e., there are no buds at the lateral shoots). The positions of the lateral branches are alternating (left-right-left-right-...) along the stem. The simulation shall start with an apical bud.

(b) Modify the model by introducing a trend: Assume that the annual shoots get 10 per cent shorter each year.

(c) Assume additionally that the apical bud produces a flower (= a large blue cone) after 7 years, and that the plant then stops to grow.

Test your solutions with GroIMP.

Remarks: By **M(-s)** you can cause the turtle to move back along the main axis by stepsize s . **Cone(h, r)** stands for a cone with height h and radius r .

4. Open the example "Molecules" in GroIMP's built-in example portfolio.

Make several model runs by clicking on the buttons "Run run" and "Reset", and observe what happens.

Now modify the model in the following ways:

(a) Increase the number of atoms from 10 to 20.

(b) Switch off the output of text to the console.

(c) Double the distance threshold for formation of a bond between two atoms.
