Model principles:

- Local hormone synthesis (**auxin**, **cytokinin**, **strigolactone**)
- Mutual influence of hormone levels on synthesis
- Hormone turn-over

Model principles:

- Local hormone synthesis (**auxin**, **cytokinin**, **strigolactone**)
- Mutual influence of hormone levels on synthesis
- Hormone turn-over
- Directional hormone **transport**
- Internode **transport capacity** for auxin, limited by SL level

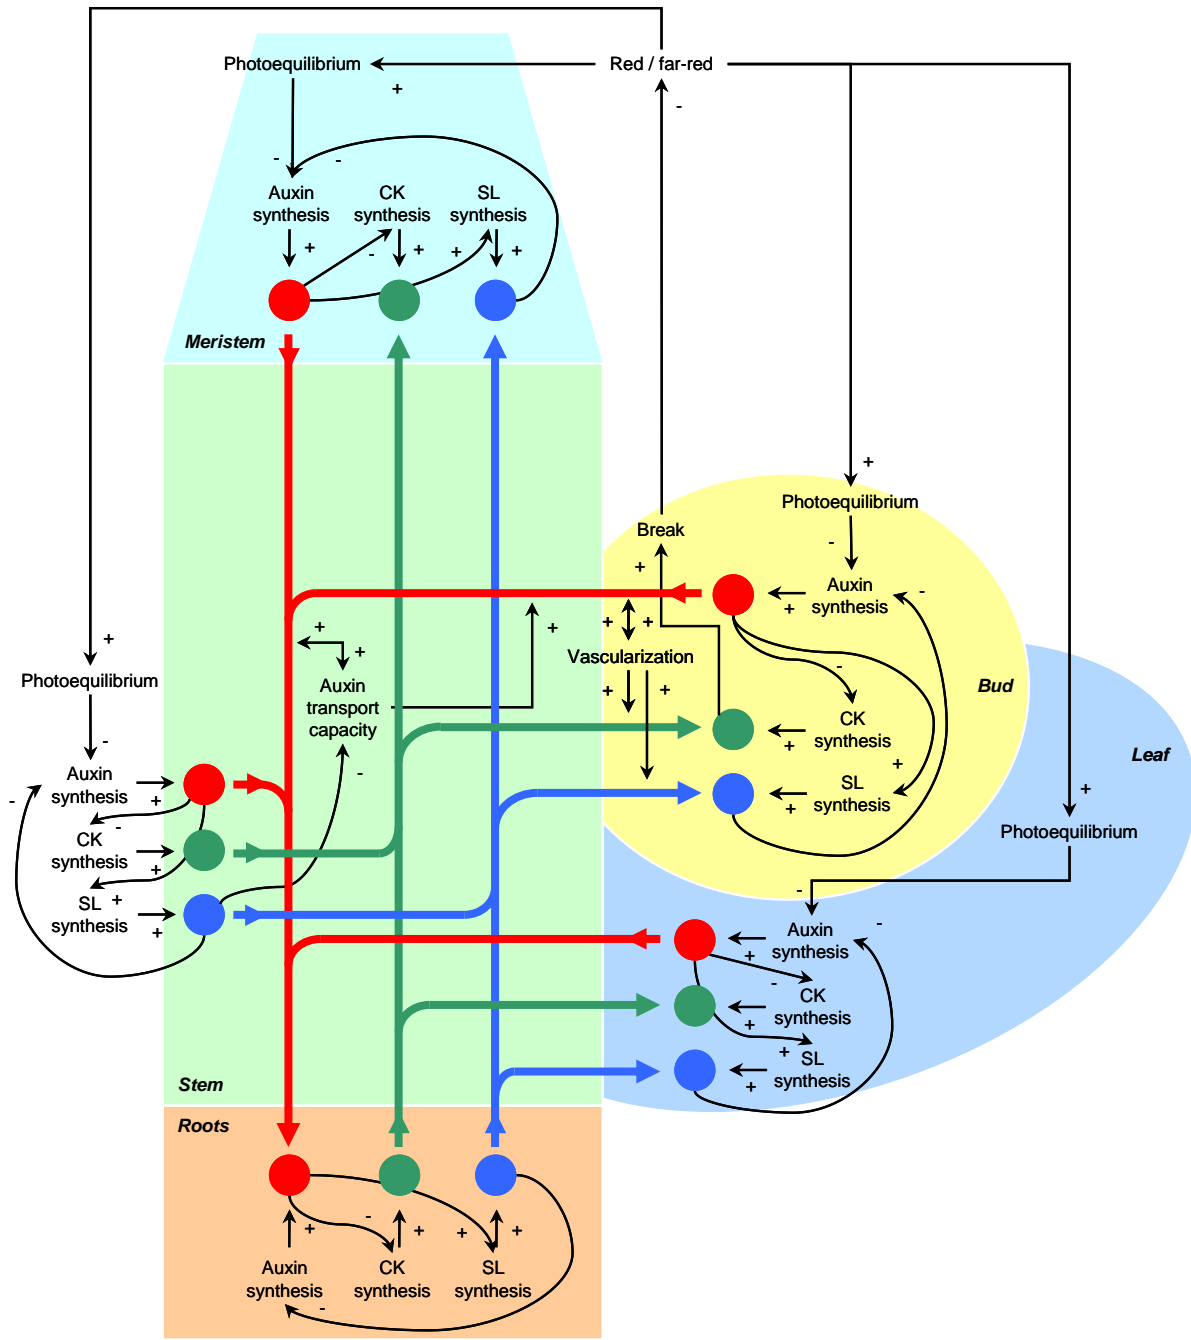

Model principles:

- Local hormone synthesis (**auxin, cytokinin, strigolactone**)
- Mutual influence of hormone levels on synthesis
- Hormone turn-over

- Directional hormone **transport**
- Internode **transport capacity** for auxin, limited by SL level

- Bud auxin export at low rate (no vessels) or high rate (vascularised)
- CK and SL import in bud only after vascularisation
- Bud break at sufficiently high bud CK level

General implementation

- Two projects:
 - Schematic stick model without light
 - Realistic plant model with light
- *hormone.rgg* – separate file containing ODEs and abstract module Organ

'Stick model' implementation

- Coded in XL (GroIMP)
- ODEs solved using the **Rate Assignment Operator**
- Considers apex, internodes, buds
- Root system: black box

Undisturbed development

max mutant (no SL)

Prusinkiewicz *et al.* (2009)

Decapitation

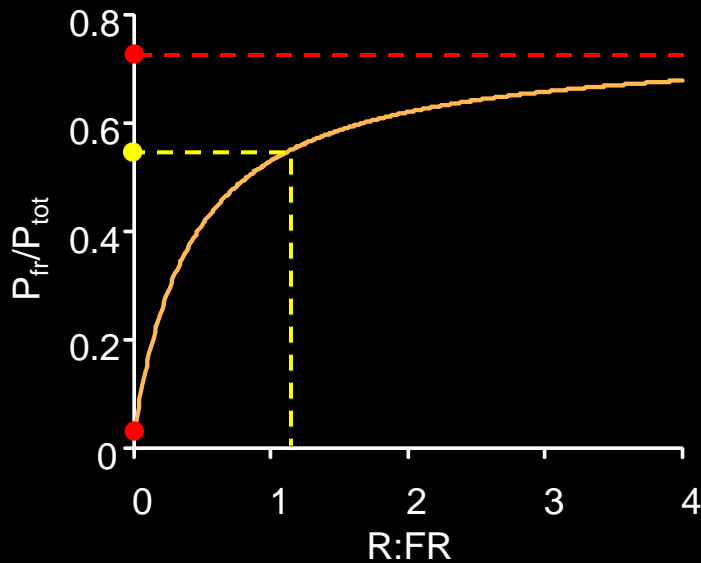

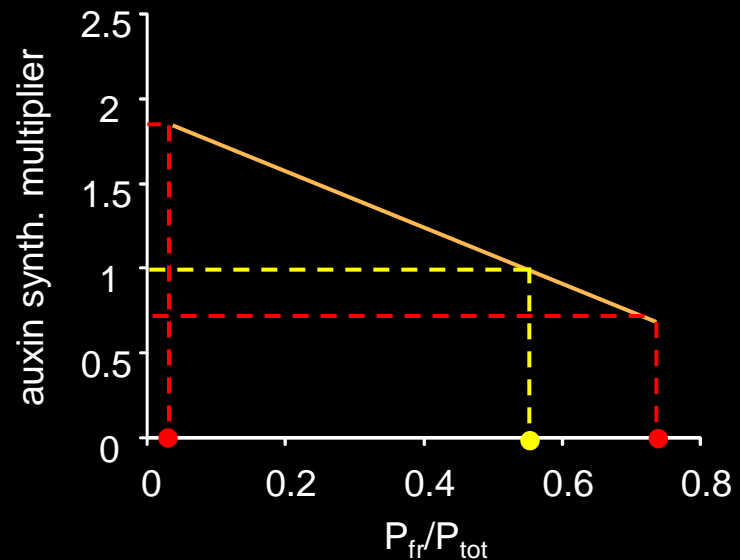

Cline (1996)

Arabidopsis implementation

- Realistic plant architecture
- Red and far-red absorption, reflection and transmission
- Relationship R:FR – phytochrome photoequilibrium
- Relationship phytochrome photoequilibrium – auxin synthesis

(Burema, 2007)

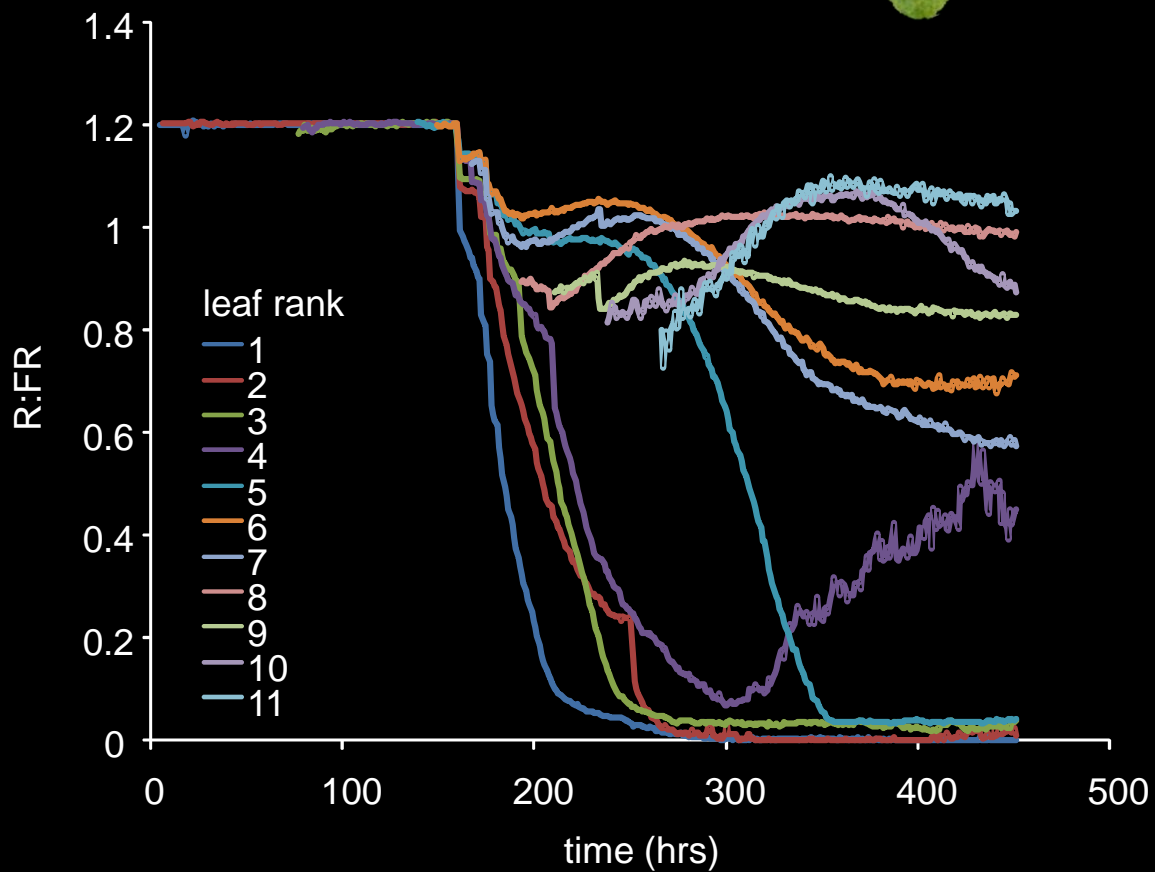

Arabidopsis implementation

- Coded in XL (GroIMP)
- ODEs solved using the **Rate Assignment Operator**
- Light calculated using the **Monte-Carlo Path Tracer**

ambient R:FR = 1.2

ambient R:FR = 0.01

wild-type

Col (WT) *max4*

Prusinkiewicz *et al.* (2009)

max4-mutant

Next steps:

- Improved parameterization of hormone regulatory network model
- Relationship hormone **level vs response**
- Improved **auxin transport** model (Prusinkewicz *et al.* 2009)

Next steps:

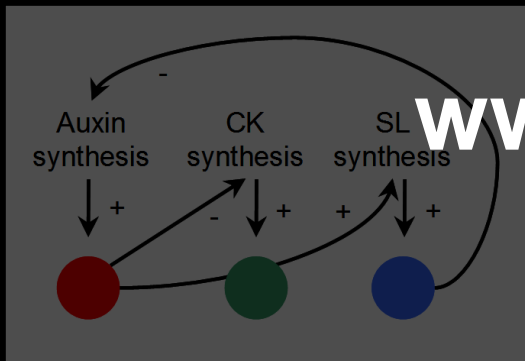

- Improved parameterization of hormone regulatory network model
- Relationship hormone **level vs response**
- Improved **auxin transport** model (Prusinkewicz *et al.* 2009)

- Analysis of branching of wt and mutants (*brc1*, *phyB*, *max*) under low and high R:FR
- Contrasting genotypes of Arabidopsis
- Root architecture & soil nutrient status

- Implementation in crop plant model (e.g. rapeseed, rice)
- Community- / field-level
